

Save Functionality & Tags attached to the post (by any user, either creator or other user) should not be removable. Users should only be able to add tags to id's.

On click of the (+) button on an ID, the ID needs to be marked under saved category at the DB level under the details of that clicked user and that ID need to be retrieved when on selection from the 'ShowMe' dropdown 'Saved' option. Then, post this action:

a. The user needs to be displayed with the tags editing section? - If yes, now editing tags need to be restricted to only the owner of the ID or any user can add new tags for any ID?

b. Since we are using a textarea (tag editing section), I doubt we would be able to restrict the user from modifying/deleting the old tags (partial locking may not be feasible). Or else we can have a new text field for new set of tags.

-> What we can do to solve this is as you suggested. We can create a new text field for a new set of tags, which can be added to by users other than the creator, while maintaining a separate set of creator-set tags.

To summarize, the functionality should be as follows:

1. When user clicks on (enlarges) id, they should be shown only tags **initially assigned by the creator**
2. When user clicks on (+), id should be **Saved** (and be accessible through selecting 'Saved' on Show Me dropdown)
3. Also when user clicks on (+), they should be **prompted with an empty text field titled 'Add Tags'**

In this text field, no need to display other tags that have been assigned by other users who have saved the id. All such tags (added by other users, not initially by the creator) should be saved to the id on a DB level.

c. What should the number displayed under (+) symbol indicate now?

-> It should indicate the number of saves made for that ID by all users till date

If both are to be made, then suppose if at all the user need to only add tags to the ID then the ID would be saved and then tag edit textarea section would be opened. Need clarity.

-> This is a valid issue. To solve this, could we add a small button in the tags area (of the attached tag icon) that opens up the [empty] text field for user to add tags to post?

Regardless, when a user saves a post, the tag entry field should be displayed.

Related to Push Functionality :

One user would be having 3 Pushes per day, and if a user pushes an ID once, should he be allowed to Push the ID again? or one user can push an ID only once?

-> User should be able to Push an id only once.

Related to Follow User and Post Notifications Functionality:

Once a user clicks on Follow User option on an ID, he would be following up that particular ID creator (following that user) - What should this do exactly?

The logged in user is able to already view the wanting to follow user's ID, and hence what should Follow User option add to it? Just the followed users IDs needs to be displayed on opting for "Following" option under ShowMe dropdown?

-> Yes, when user selects 'Following' on Show Me dropdown, user should be displayed all id's from other users they are Following. Further, when user A -> Follows user B, user A is given the option to turn on 'Post Notifications' for user B, ie. whenever user B posts an id, user A gets a notification saying 'User B created a new id'.

From 'BigID Alpha Specs' p. 5

Post Notifications : On enabling post notifications on a particular ID, it seems like the clicked user is interested to get notifications if any in future related to that ID on any more comments or replies from anyone? Require clarity

-> After a user saves an id, they should be shown a button (similar to above) to turn on post notifications. (This is similar to how push gets displayed after user upvotes).
